# Sumerian Contains Dravidian and Uralic Substrates Associated with the Emegir and Emesal Dialects 

PETER Z. REVESZ<br>Department of Computer Science and Engineering<br>University of Nebraska-Lincoln<br>Lincoln, NE 68588-0115<br>USA<br>revesz@cse.unl.edu, http://cse.unl.edu/~revesz/

#### Abstract

Data mining the Sumerian vocabulary reveals a dichotomy of the cognate associations of the Emegir and the Emesal dialects, with the former having mostly Dravidian and the later mostly Uralic cognates, indicating that Sumerian arose by the combination of two languages from those language families. The data mining also reveals a distribution pattern of Proto-Uralic, Proto-Finno-Ugric, Proto-Ugric and Proto-Hungarian cognates that indicates that Sumerian is farther than Minoan from Hungarian, although all are West-Ugric.

Key-Words: - computational linguistics, data mining, Dravidian, language family, Emesal, Sumerian, Uralic

## 1 Introduction

Some early Sumerologists (Lenormant, Oppert, Rawlinson) already noted similarities between Sumerian and Hungarian [55]. That line of work was extended by Badinyi [3], Baráth [4], Bobula [8], Csőke [10], Gosztonyi [19], Götz [20] and Tóth [46]. Unfortunately, they largely ignored Uralic linguistics in their work [23]. Simo Parpola [34] recently presented Uralic etymologies for over three thousand Sumerian words. Parpola's idea of adding Sumerian to the Uralic language family is more credible. However, he did not consider the possibility that Sumerian is not only a Uralic language.

The idea that Sumerian may belong to several language families is inspired by our earlier work on the Minoan language, whose vocabulary was to a large extent adopted by the ancient Greek language. We analyzed the ancient Greek vocabulary by looking for cognates in the following layers established by Uralic linguists [26]:

1. Uralic
2. Finno-Ugric
3. Ugric
4. Proto-Hungarian

The comparison yielded 22, 31 and 91 cognate ancient Greek words that belong to the Uralic, Finno-Ugric and Ugric layers, respectively. Beekes [5, 6] regarded most of those ancient Greek words as Pre-Greek, indicating that they could be borrowings from the earlier Minoan language in the

Aegean area. The Minoan language was written in the previously undeciphered Cretan Hieroglyph and Linear A scripts $[12,13,14,17,18,30,31,32,33$, 51, 52, 53] from which the earliest Greek script called Linear B developed [9, 49].
The surmised vocabulary, grammatical analysis, and some similarities within the Cretan Script Family [37], which includes the Minoan scripts, the Carian alphabet [2] and the Old Hungarian alphabet (called rovásírás in Hungarian) [15, 24, 43, 48], allowed the translation of over twenty texts (Revesz [38, 39, 40, 41]) with contents that fit into the Minoan cultural context [28]. Our translations suggested that Minoan, Hattic and Hungarian belong to a common (West)-Ugric branch of the Uralic language family [41].

Our work also implied that Greek is a descendant of two language families, i.e., both Indo-European and Uralic (see Fig. 3). That duality explains some of Greek's unique features with respect to other Indo-European languages. The example of Greek raised the possibility that Sumerian may also be a language that belongs to several language families. That would explain why Sumerian has some word similarities with many languages. For example, Muttarayan [29] found many word similarities between Sumerian and Tamil.

The rest of this paper is organized as follows. Section 2 presents an analysis of Sumerian and Uralic cognates that fall within the Uralic, FinnoUgric, Ugric and Proto-Hungarian layers.

While doing the linguistic layer analysis, we discovered an interesting novel pattern. This pattern is that the Emesal dialect of Sumerian contains a
disproportionate number of the cognate words. Section 3 of this paper compares the Emesal and the Emeĝir dialects of Sumerian. The significant differences between these two dialects suggest an incomplete integration of two language families, namely, Dravidian and Uralic.

The natural question that arises is which of the two language families existed earlier in Mesopotamia and which came later to the area. Section 4 considers this question by analysis of the vocabulary of the Euphratic language, which was suggested by Whittaker [50] and others as a substrate of Sumerian.

Section 5 considers Sumerian and Hungarian phonetic correspondences. Section 6 considers Minoan and Hungarian language similarities and a parser for a subset of the Minoan language. Section 7 discusses the results and related work. Finally, Section 8 presents some conclusions and directions for future work.

## 2 Sumerian and Uralic Cognates

We collected possible Hungarian and Sumerian cognates by looking up the meaning of all the words that are listed as Uralic or Finno-Ugric by Zaicz [54] or are listed as Ugric by Honti [21] in the ePDS, the online version of the Pennsylvania Dictionary of Sumerian [44]. We also crosschecked all candidate cognates with the etymological dictionaries of Parpola [34] and Zaicz [54], the Mansi Dictionary of Munkácsi and Kálmán [27], the ancient Greek etymological dictionary of Beekes [5, 6], and the Hungarian-Greek dictionaries of Aczél [1] and Varga [47]. Table 1 shows the cognate groups that were collected.

In Table 1 and in the rest of this paper, when $x$ and $y$ are words, then the notation $x \sim y$ indicates that words $x$ and $y$ are cognates, $x>y$ indicates a derivation from $x$ to $y$ and *x indicates a hypothetical form that is not attested in writing. The notation $x^{L}(m)$ denotes that $x$ occurs in language $L$ and means $m$ in English. The similar consonant sounds are highlighted in red, inserted glide consonants are highlighted in blue, and omitted sounds are indicated by underscores.

The third column in Table 1 is based on Parpola [34] and Zaicz [54] while the fourth column is based mostly on Beekes [5, 6] with a few minor additions. Our additions include in the row for 'three' the word háromszor ${ }^{\text {Hungarian }}$ (thrice) and its Mansi connection based on [27], and in the row for 'sword' its connections, including a possible borrowing of this word from Ossetian based on [54]. We also added a row for 'lady, woman' based on [27], although it is commonly thought to be a
borrowing from Alan language [54]. Finally, we also added the row for 'breeze' because the Hungarian and the Estonian words show a remarkable similarity, although Zaicz [54] claims that the Hungarian word is onomatopoeic in origin. In the Ugric group (shown by yellow color in Table 1), we extended Honti's list by the row for 'cry, yell.' Each number in the last column of Table 1 refers to the Sumerian entry number in Parpola [34]. The dash --- indicates that no corresponding entry was found in Parpola [34]. Such dashes were rare in the Uralic and the Finno-Ugric entries and tended to be more frequent in the Ugric entries, indicating that the Ugric part of Parpola's dictionary could still be significantly extended.

The presence of the fourth column for ancient Greek adds a corroborative element because Greek has borrowed many Pre-Greek words from the Minoan language, which we already identified as an Ugric language. The Greek and Sumerian word pairs in Table 1 do not indicate direct borrowings from Sumerian to Greek but parallel borrowings from a Uralic substrate that preexisted in Anatolia and near by regions before the arrival of Sumerians in Mesopotamia and Greeks in the Aegean area.

Table 2 and Fig. 1 compare the number of Hungarian and Sumerian cognates that were found with the number of Hungarian and ancient Greek or presumed Minoan cognates that were found in [41]. The total number of cognates found was nearly the same with 144 and 173 , respectively. However, the ratio of Sumerian cognates divided by ancient Greek cognates showed an interesting pattern for the different layers They were 2.18 for the Uralic, 2.56 for the Finno-Ugric and only 0.51 for the Ugric layer.

At the same time, we found a few Hungarian words with unknown origin that may be cognate with Sumerian words or ancient Greek or Minoan words. We did not gather statistics on these because a systematic search would need to consider a huge set of words, that is, much more than the few hundred well-established words that belong to the Uralic, Finno-Ugric and Ugric layers. However, the number of words that are not shared also with the Ob-Ugric group of Khanty and Mansi languages suggests that there was a West-Ugric language that was a common origin of Proto-Hungarian, ProtoMinoan and Proto-Sumerian. This West-Ugric hypothesis seems initially puzzling in light of the sharp drop of percentages shown in Table 2. It suggests a different survival rate for the words in various layers. Discovering the reasons for this differentiated survival was a major motivation for the experiments described in Sections 3 and 4.

## 3 Emesal Ugric and Emeĝir Dravidian

This section presents a dialect analysis of the Sumerian language. The Sumerian language is known to have two major dialects, namely the Emeĝir dialect and the Emesal dialect, which differ on several important words. The existence of several words for the same concepts commonly results from borrowing words from another language. For example, English is a Germanic origin language with an extensive borrowing from Romance languages due to its developmental history. As a result English has many word pairs for the same concept, such as freedom and liberty, food and aliment etc. Hence the question naturally arose whether Emeĝir and Emesal manifest a similar phenomenon or do the same.

Table 3 shows that many Emesal words have Uralic cognates. For example, ma ${ }^{\text {Emesal }}$ (to go) seems cognate with menni ${ }^{\text {Huggarian }}$ (to go), while $\mathrm{du}^{\text {Emegir }}$ (to go) is not cognate with Uralic words. However, du ${ }^{\text {Emegir }}$ (to go) may be cognate with naṭ ${ }^{\text {Tamil }}$ (to go).

Similarly, mu ${ }^{\text {Emesal }}$ (tree) seems cognate with puu ${ }^{\text {Finish }}$ (tree), while geses ${ }^{\text {Emegir }}$ (tree) may be cognate with kāṭu ${ }^{\text {Tamil }}$ (forest).

Table 3 shows a total of 31 Emesal-Emeĝir word pairs that show the same distribution. The Emesal words are all cognate with Hungarian words while the Emeĝir words are all cognate with Tamil or other Dravidian words.

The finding in Table 3 explains why Sumerian is difficult to classify. Sumerian seems to be a language that inherited features from both the Uralic and the Dravidian language families, which is a combination that is not seen in other languages. In addition, Sumerian is known only from writing, and most of the extant Sumerian writing was done not by the Sumerians themselves but by Akkadians and Babylonians, who may have conformed some Sumerian words to their own preferred pronunciations. Therefore, it is rather remarkable to detect the emergent pattern in Table 3.

It is probably difficult to identify with complete confidence what words are of Dravidian and Uralic origin because these two languages were already fairly well integrated in Sumerian society. However, some words by their meaning may be more naturally associated with the north than with the Indian subcontinent. For example, dur ${ }^{\text {Sumerian }}$ ( $a$ bird) may be cognate with daru ${ }^{\text {Hungarian }}$ (crane). Cranes are migrating birds and Uralic people from the north would have been familiar with them and could have brought their name to Mesopotamia. Similarly, the word dér ${ }^{\text {Hungarian }}$ (frost), which describes a condition that is rare in Mesopotamia,
may have become duru ${ }^{\text {Sumerian }}$ (wet). Similarly, the words su-ba ${ }^{\text {Emesal }}$ (shepherd) and munu ${ }^{\text {Emesal }}$ (herd) are commonly associated with the herding large groups of animals on the Eurasian Steppe and not with the agricultural life along the riverbeds of Mesopotamia. Hence their Hungarian etymologies are not surprising. Nor is it surprising that su$\mathrm{ba}^{\text {Emesal }}$ (shepherd) may be cognate with çoban ${ }^{\text {Turkish }}$ (shepherd) because some Turkic people may have shared the Eurasian Steppe shepherding lifestyle.

As another example, šu-mu-un ${ }^{\text {Emesal }}$ (grass) is cognate with sövény ${ }^{\text {Hungarian }}$ (hedging), which is derived from sző ${ }^{\text {Hungarian }}$ (weave) and vény ${ }^{\text {Hungarian }}$ (noun forming suffix). It is possible that this 'grass' was hemp or some other crop, whose fibers were used to weave cloth. Such plants may have been planted at the edge of fields as hedging. A Sumerian word related to cooking is ki-šum$\mathrm{ma}^{\text {Sumerian }}$ (onion plot), which may be cognate with kośem ${ }^{\text {Mansi }}$ (onion) $+\mathrm{m}^{\text {Mansi }}$ (land) and $\mathrm{maa}^{\text {Finnish }}$ (land). The hemp and onion plants also may have come to Mesopotamia from the north.

Metallurgy was more developed in the mountain regions of the north, where metals could be mined. Therefore, the Sumerians may have borrowed simug ${ }^{\text {Sumerian }}$ (smith) from the people in the north, and it is likely cognate with seppa ${ }^{\text {Finnish }}$ (clever, smith) as also described in item 2192 of Parpola [34].

## 4 Euphratic is an Ugric Language

Since Sumerian apparently resulted from a combination of two language families, it raises the question of when the two languages arrived to Mesopotamia. What was the original language of Mesopotamia? Whittaker [50] identified an early substrate language within Sumerian that he called Euphratic. The Euphratic language vocabulary seems to be a set of words that occur in the earliest extant Sumerian texts and share certain characteristic endings and morphologies.

We have considered the set of Euphratic words as identified by Whittaker [50]. Table 4 and Fig. 2 show that at least eighteen Euphratic words have Uralic etymologies. We also considered whether these eighteen words have Dravidian etymologies, but we found some resemblance only in three cases. The case for 'eagle' being a cognate is weakened by the fact that it is not found in Tamil but only in Telegu. Moreover, there is a mismatch between the $/ \mathrm{n} /$ in hurin ${ }^{\text {Euphratic }}$ and the $/ \mathrm{k} /$ in kaluku ${ }^{\text {Telegu. }}$. The word holló ${ }^{\text {Hungarian }}$ seems to omit an earlier / $\mathrm{n} /$ ending as suggested by kaarne ${ }^{\text {Finnish }}$. In $\bar{a} \underline{n}^{\text {Tamil }}$ the similarity is only one letter. Finally, the gud ${ }^{\text {Euphratic }}$ and kallai ${ }^{\text {Tamil }}$ may indeed be cognate. Cattle were
likely introduced from one area to the other. Hence the name for cattle may be a trade word that spread widely at the earliest stages of cattle domestication. Therefore, even if these words are cognate, they are more likely to be associated with the movement of cattle as a trade good than with the movement of a large number of people.

We also made some effort to identify the other Euphratic words in Whittaker [50] as either Dravidian or Uralic but failed to find more cognates. Hence, Euphratic is most likely Uralic.

## 5 Sumerian and Hungarian Regular Phonetic Correspondences

Parpola [34] did not present regular phonetic correspondences. Below we give a reconstruction of West-Ugric phonetics and show regular phonetic correspondences among three of its members: Hungarian, Minoan and Sumerian. It is only appropriate to talk about phonetic correspondences, denoted by $\sim$, among those three, while it is possible to talk about phonetic changes, denoted by $>$, from West Ugric to them.

Table 6 summarizes the sixteen main phonetic correspondences among Greek words with PreGreek, that is Minoan origin, and Hungarian and Sumerian based on the cognates collected in Table 1. We reconstructed the West-Ugric phonemes by considering all members, the Ob-Ugric forms, and the assumed phoneme repertoire at the beginning of the Proto-Hungarian period [26]. Table 6 gives the International Phonetic Alphabet notation, where the pronunciation may not be obvious.

Each row of Table 6 can be taken as a separate correspondence rule between Hungarian and Sumerian and two derivation rules, one from WestUgric to Hungarian and another from West-Ugric to Sumerian.

Rule (1): The following triplets in Table 1 demonstrate that West-Ugric preserved the word initial $/ \mathrm{J} / /$ as did Sumerian, while Hungarian lost it:

It may be supposed from the third and fourth examples that in West-Ugric and Sumerian even the world initial $/ \mathrm{s} /$ could have been preserved. In that case those $/ \mathrm{s} /$ had to change to $/ \mathrm{S} /$ before the Hungarian sound change sequence $/ \mathrm{S} />/ \mathrm{h} / \mathrm{>} / \mathrm{l} /$ began.

Rule (2): West-Ugric word initial /tf/ was likely preserved in Hungarian, changed to $/ \mathrm{s} /, / \mathrm{J} /$, or $/ \mathrm{z} /$ in Sumerian and to $\sigma$ in Greek.

Rule (3) West-Ugric word initial /s/ Hungarian, changed to $/ \mathrm{s} /$, $/ \mathrm{J} /$, or $/ \mathrm{z} /$ in Hungarian and Sumerian and to $\sigma$ or may be $\theta$ in Greek.

Rule (4): The West-Ugric /d/ is preserved in both Hungarian and Sumerian.

Rule (5): The West-Ugric word initial /t/ is always preserved in Hungarian. It is also preserved in Sumerian when the following consonant is a bilabial $/ \mathrm{b} /, / \mathrm{p} /$, $/ \mathrm{v} /$ or a nasal $/ \mathrm{m} /$ or $/ \mathrm{n} /$ :

Sumerian changes the West-Ugric word initial $/ \mathrm{t} /$ to $/ \mathrm{d} /$ when the following consonant is $/ \mathrm{l} /$ or $/ \mathrm{r} /$ :

| $\text { talál }{ }^{\text {Hungarian }}$ | $\sim$ tola $^{\text {Mari }}$ | $\sim \mathrm{dul}^{\text {Sumerian }}$ |
| :---: | :---: | :---: |
| tél ${ }^{\text {Hungarian }}$ | $\sim$ talvi ${ }^{\text {Finnish }}$ | $\sim \mathrm{dal}^{\text {Sumerian }}$ |
| telek ${ }^{\text {Hungarian }}$ toll ${ }^{\text {Hungarian }}$ | $\begin{aligned} & \sim \text { tarimt }^{\text {Khanty }} \\ & \sim \text { tēl }^{\text {Mansi }} \end{aligned}$ | $\begin{aligned} & \sim \text { dal-ba-na }^{\text {Sumerian }} \\ & \sim \text { dal }^{\text {Sumerian }} \end{aligned}$ |
| tőr ${ }^{\text {Hungarian }}$ | $\sim$ tir $^{\text {Votyak }}$ | $\sim d^{\text {dum }}$ Sumerian |
| türök ${ }^{\text {Hungarian }}$ | $\sim$ teura $^{\text {Finnish }}$ | $\sim$ durah $^{\text {Sumerian }}$ |
| tü Hungarian | $\sim$ tāl ${ }^{\text {Mansi }}$ | $\sim$ dálla $^{\text {Sumerian }}$ |

If an initial vowel is inserted, then the $/ \mathrm{t} /$ does not change in Sumerian even if the following consonant is / $/ \mathrm{l}$ or $/ \mathrm{r}$ /:

A West-Ugric word medial /t/ undergoes palatalization to /c/ in Hungarian:

$$
\begin{aligned}
& \text { atya }^{\text {Hungarian }} \sim \text { ättä }^{\text {Finish }} \sim \text { ad-da }^{\text {Sumerian }} \\
& \text { hattyü }^{\text {Hungarian }} \underset{\sim \text { kotan }^{\text {Mansi }}}{\sim \text { gud-du }_{7} \text { Sumerian }}
\end{aligned}
$$

In the first example the gemination is preserved even as $/ \mathrm{t} / \mathrm{changes}$ to a $/ \mathrm{d} /$. In the second example the West-Ugric and the Ugric forms probably had also a geminate $/ t /$, which is preserved in both Hungarian and Sumerian.

A West-Ugric final /t/ is preserved in Hungarian and changes to $/ \mathrm{d} /$ in Sumerian:

$$
\begin{aligned}
& \text { két }^{\text {Hungarian }} \sim \text { kit }^{\text {Mansi }} \sim \text { kad }^{\text {Sumerian }} \\
& \text { sötét }^{\text {Hungarian }}
\end{aligned} \sim \text { šätep }^{\text {Mans }} \sim \text { zud }^{\text {Sumerian }}
$$

or changes to a fricative $/ \mathrm{S} /$ or $/ \mathrm{z} /$ in Hungarian or both:

$$
\begin{aligned}
& \text { húz }^{\text {Hungarian }} \sim \text { kåt }^{\text {Mansi }} \sim \text { gid }^{\text {Sumerian }} \\
& \text { kéz }^{\text {Hungarian }} \sim \text { kät }^{\text {Mansi }} \sim \text { kišib }^{\text {Sumerian }}
\end{aligned}
$$

The last example suggests either an incipient word final $/ \mathrm{t} /$ to fricative change in West-Ugric, which was continued only in Hungarian, or more likely an influence from the $\mathrm{ib}^{\text {Sumerian }}$ (hips; middle) suffix. While kéz ${ }^{\text {Hungarian }}$ normally means the palm of the hand, kišib ${ }^{\text {Sumerian }}$ more likely meant the wrist or forearm.

Rule (6): West-Ugric word initial $* \beta$ is preserved in both Hungarian and Sumerian:

$$
\text { bőr }^{\text {Hungarian }} \sim \text { pěr }^{\text {Khanty }} \sim \text { bar }
$$

The presence of word initial /b/ not only in the Hungarian and Sumerian words but also in the cognate ancient Greek work $\beta v \rho \sigma \alpha^{\text {Greek }}$, suggests that the change from $/ \mathrm{p} /$ to $/ \mathrm{b} /$ already occurred West-Ugric and it was not a separate event in Hungarian and Sumerian.

Rule (7): The West-Ugric word final consonant cluster $/ \mathrm{mp}$ / changes to $/ \mathrm{b} /$ in both Hungarian and Sumerian:

$$
\text { hab }^{\text {Hungarian }} \sim \text { kump }^{\text {Khanty }} \sim \text { gúb }^{\text {Sumerian }}
$$

Rule (8): The West-Ugric word initial /p/ always changes to /f/ in Hungarian, while in Sumerian it changes to $/ \mathrm{b} /$ if the consonant following it is a liquid $/ 1 /$ or $/ \mathrm{r} /$ :

| fal $^{\text {Hungarian }}$ | $\sim$ păl $^{\text {Khanty }}$ | $\sim$ ba-ar $^{\text {Sumerian }}$ |
| :--- | :--- | :--- |
| far $^{\text {Hungarian }}$ | $\sim$ perä $^{\text {Finnish }}$ | $\sim$ bar $^{\text {Sumerian }}$ |
| farag $^{\text {Hungarian }}$ | $\sim$ pār $^{\text {Mansi }}$ | $\sim$ bar $^{\text {Sumerian }}$ |
| fél $^{\text {Hungarian }}$ | $\sim$ päl $^{\text {Mansi }}$ | $\sim$ bar $^{\text {Sumerian }}$ |
| fél $^{\text {Hungarian }}$ | $\sim$ pěl $^{\text {Khanty }}$ | $\sim$ bu-luh $^{\text {Sumerian }}$ |
| fokos $^{\text {Hungarian }}$ | $\sim$ po $^{\text {Khanty }}$ | $\sim$ bulug $^{\text {Sumerian }}$ |
| fordul $^{\text {Hungarian }}$ | $\sim$ porjal $^{\text {Votyak }}$ | $\sim$ bùru $^{\text {Sumerian }}$ |
| fúl $^{\text {Hungarian }}$ | $\sim$ pulp $^{\text {Mansi }}$ | $\sim$ bulug $^{\text {Sumerian }}$ |
| fürt $^{\text {Hungarian }}$ | $\sim$ per $^{\text {Votyak }}$ | $\sim$ buru $_{14}$ |

The West-Ugric word initial /p/ is preserved in other cases:

| fa $^{\text {Hungarian }}$ | $\sim$ puu $^{\text {Finnish }}$ | $\sim$ pa $^{\text {Sumerian }}$ |
| :--- | :--- | :--- |
| fejsze $^{\text {Hungarian }}$ | $\sim$ päćt $^{\text {Mansi }}$ | $\sim$ pa-a-šu |
| Sumerian |  |  |
| fészek $^{\text {Hungarian }}$ | $\sim$ pesä $^{\text {Finnish }}$ | $\sim$ pisag $_{\text {Sumerian }}$ |
| fog $^{\text {Hungarian }}$ | $\sim$ pekat $^{\text {Khanty }}$ | $\sim$ pag $^{\text {Sumerian }}$ |
| fon $^{\text {Hungarian }}$ | $\sim$ pǎn $^{\text {Khanty }}$ | $\sim$ pan $^{\text {Sumerian }}$ |

The Hungarian change from $/ \mathrm{p} /$ to $/ \mathrm{f} /$ occurs only word-initially, except in compound words:

$$
\text { ifjún }{ }^{\text {Hungarian }}=\mathrm{i}^{\text {Hungarian }}(\text { young })+\text { fiú }{ }^{\text {Hungarian }}(\text { male })
$$

A version of the above compound word could have been formed even in West-Ugric, that is, before the Hungarian word initial /f/ to /p/ change took place. Therefore, it looked like the following:

$$
*_{\text {ipiu }}{ }^{\text {West-Ugric }}
$$

In the above word the medial $/ \mathrm{p} /$ would have changed to $/ \mathrm{b} /$ in Sumerian, which is a regular phenomemnon:

$$
\begin{array}{lll}
\text { apa }^{\text {Hungarian }} & \sim \text { opp }^{\text {Khanty }} & \sim \text { abba }^{\text {Sumerian }} \\
\text { csupor }^{\text {Hungarian }} & \sim \text { ćcipiš }^{\text {Zyrian }} & \sim \text { zabar }^{\text {Sumerian }} \\
\text { ifjú }^{\text {Hungarian }} & \sim \text { *ipiu }^{\text {West-Ugric }} & \sim \text { ibila }^{\text {Sumerian }}
\end{array}
$$

The West-Ugric word final /p/ also changes regularly to $/ \mathrm{p} /$ in Hungarian and $/ \mathrm{b} /$ in Sumerian:

| süpped $^{\text {Hungarian }}$ | $\sim$ šēp $^{\text {Mansi }}$ | $\sim$ šub $^{\text {Sumerian }}$ |
| :--- | :--- | :--- |
| szép $^{\text {Hungarian }}$ | $\sim$ seppä $^{\text {Finnish }}$ | $\sim$ ze-eb |
| Szopikerian $^{\text {Hungarian }}$ | $\sim$ sip $^{\text {Mansi }}$ | $\sim$ sub $^{\text {Sumerian }}$ |
| tapos $^{\text {Hungarian }}$ | $\sim$ tapte $^{\text {Mari }}$ | $\sim$ tab $^{\text {Sumerian }}$ |

Rule (9): West-Ugric word intitial $/ \mathrm{h} /$ is either preserved or omitted. The omission seems more common in longer words.

| hal ${ }^{\mathrm{H}}$ | a | ulu |
| :---: | :---: | :---: |
| háromszor ${ }^{\text {Hungarian }} \sim \chi$ ūrėmśos ${ }^{\text {Mansi }} \sim$ am $_{3}$-mu-uš ${ }^{\text {Sum. }}$ |  |  |
| holló ${ }^{\text {Hungarian }}$ | $\sim$ kolāk $^{\text {Mansi }}$ | $\sim$ hurin $^{\text {Sumerian }}$ |
| rzsol ${ }^{\text {Hungarian }}$ | $\sim$ karśel $^{\text {Man }}$ | $\sim h^{\text {ur }}{ }^{\text {Su}}$ |
| sszú ${ }^{\text {Hungarian }}$ | $\sim$ košew $^{\text {Mansi }}$ | $\sim$ éše ${ }^{\text {Sur }}$ |
| $u n y{ }^{\text {Hungarian }}$ | $\sim$ kǒñ ${ }^{\text {Khanty }}$ | $\sim \overline{h u n a ~}^{\text {Sum }}$ |

All of the above examples are from the ProtoUralic layer except horzsol ${ }^{\text {Hungarian }}$, which is from the Finno-Ugric layer. That suggests that the initial $/ \mathrm{k} /$ already underwent lenition to $/ \mathrm{h} /$ in Proto-WestUgric. Moreover, in the second example the Mansi word also underwent partial lenition.

An alternative would be to assume that WestUgric words did not have an initial $/ \mathrm{h} /$ but only an initial $/ \mathrm{k} /$. In that case, they underwent lenition idependently in Hungarian and Sumerian as discussed in the next rule.

Rule (10): The West-Ugric initial /k/ has underwent various degrees of lenition. In Hungarian, word initial $/ \mathrm{k} /$ changes to $/ \mathrm{h} /$ when it followed by a back vowel:

| hab $^{\text {Hungarian }}$ | $\sim$ kump $^{\text {Khanty }}$ | $\sim$ gúb $^{\text {Sumerian }}$ |
| :--- | :--- | :--- |
| hagyma $^{\text {Hungarian }}$ | $\sim$ košem $^{\text {Mansi }}$ | $\sim$ ki-šum-ma $^{\text {Sumer. }}$ |
| hal $^{\text {Hungarian }}$ | $\sim$ koule $^{\text {Finnish }}$ | $\sim$ ku $^{\text {Sumerian }}$ |
| hál $^{\text {Hungarian }}$ | $\sim$ kōl $^{\text {Mansi }}$ | $\sim$ ku $^{\text {Sumerian }}$ |
| halad $^{\text {Hungarian }}$ | $\sim$ koyel $^{\text {Khanty }}$ | $\sim$ kul $^{\text {Sumerian }}$ |

| hamu ${ }^{\text {Hungarian }}$ | $\sim$ kolem $^{\text {Mansi }}$ | $\sim$ kúm ${ }^{\text {Sum }}$ |
| :---: | :---: | :---: |
| hanyatt ${ }^{\text {Hungarian }}$ | $\sim$ kuntst $^{\text {Mordvi }}$ | $\sim$ kun $^{\text {Sumeria }}$ |
| hangya ${ }^{\text {Hungarian }}$ | $\sim \mathrm{kaš̌}^{\text {ej }}{ }^{\text {Mansi }}$ | $\sim$ kiši ${ }^{\text {Sumeria }}$ |
| harap ${ }^{\text {Hungarian }}$ | $\sim$ kurćći $^{\text {Zyrian }}$ | $\sim \mathrm{kur}_{8}^{\text {Sumeri }}$ |
| hattyú Hungarian | $\sim \operatorname{kotan}^{\text {Mansi }}$ | $\sim$ gud-du ${ }_{7}^{\text {Sumerian }}$ |
| ház ${ }^{\text {Hungarian }}$ | $\sim \operatorname{kota}^{\text {Finnish }}$ | $\sim$ gùd ${ }^{\text {Sumerian }}$ |
| here ${ }^{\text {Hungarian }}$ | $\sim \mathrm{kar}^{\text {Khanty }}$ | $\sim$ ğuruss ${ }^{\text {Sumerian }}$ |
| homály ${ }^{\text {Hungarian }}$ | $\sim \chi^{\text {om }}$ 入atas ${ }^{\text {Mansi }}$ | $\sim \mathrm{kana}_{6}{ }^{\text {Sumerian }}$ |
| hord ${ }^{\text {Hungarian }}$ | $\sim \mathrm{kart}^{\text {Mansi }}$ | $\sim$ gur $_{3}-\mathrm{ru}^{\text {Su }}$ |
| hölgy ${ }^{\text {Hungarian }}$ | $\sim \mathrm{kal}^{\text {Mansi }}$ | $\sim \mathrm{gal}_{4}$-la ${ }^{\text {Sumeri }}$ |
| húgy ${ }^{\text {Hungarian }}$ | $\sim \chi$ ¢̌s ${ }^{\text {Khanty }}$ | $\sim \mathrm{kas}_{3}$ Sumerian |
| húz ${ }^{\text {Hungarian }}$ | $\sim$ kåt ${ }^{\text {Mansi }}$ | $\sim$ gid $^{\text {Sumerian }}$ |

In all of the above examples, the middle column has always a back vowel. In addition, at least either the Hungarian or the Sumerian cognate also has a back vowel after the word intitial consonant. These suggest that their Proto-West-Ugric ancestors also had a back vowel after the word initial $/ \mathrm{k} /$. The deep vowel nature of the West-Ugric word for here ${ }^{\text {Hungarian }}$ is further confirmed by the cognate $\kappa о \rho о \varsigma^{\text {Greek }}$.

In addition, the ki-šum-ma ${ }^{\text {Sumerian }}$ (onion plot) probably derives from:

$$
\text { kośem }^{\text {Mansi }}(\text { onion })+m \bar{\varnothing}^{\text {Mansi }}(\text { plot, land })
$$

because the Mansi forms seems to preserve well the original West-Ugric forms. It is likely that the later Sumerians did not understand that in the above compound word the syllable m $\bar{\varnothing}$ meant 'plot, land.' Instead, they were expecting the beginning of the word to mean land, which is $\mathrm{ki}^{\text {Sumerian }}$ (place). Therefore, by folk etymology the following change could have occurred:

$$
\text { *kośem }+\mathrm{m} \bar{\varnothing}>* \text { kiśem }+\mathrm{m} \bar{\varnothing}>\text { ki-šum-ma }{ }^{\text {Sumerian }}
$$

There is no lenition of $/ \mathrm{k} /$ in Hungarian when it is followed by a front vowel:

$$
\begin{array}{lll}
\text { kéz }^{\text {Hungarian }} & \sim \text { kät }_{\text {Mansi }} \sim \text { kišib }^{\text {Sumerian }} \\
\text { kell }^{\text {Hungarian }} & \sim \text { kel }^{\text {Mari }} & \sim \text { kal }^{\text {Sumerian }} \\
\text { könyök }^{\text {Hungarian }} & \sim \text { kën }^{\text {Khanty }} \sim \text { kin }^{\text {Sumerian }}
\end{array}
$$

Rule (11): The West-Ugric word initial /l/ is always preserved. However, the West-Ugric word medial and final $/ 1 /$ could either stay $/ 1 /$ or change to an $/ \mathrm{r} /$. Here are a few examples for the latter:

| fal $^{\text {Hungarian }}$ | $\sim$ păl $^{\text {Khanty }}$ | $\sim$ ba-ar $^{\text {Sumerian }}$ |
| :--- | :--- | :--- |
| fél $^{\text {Hungarian }}$ | $\sim$ päl $^{\text {Mansi }}$ | $\sim$ bar $^{\text {Sumerian }}$ |
| holló $^{\text {Hungarian }}$ | $\sim$ kolāk $^{\text {Mansi }}$ | $\sim$ hurin $^{\text {Sumerian }}$ |
| Szalad $^{\text {Hungarian }}$ | $\sim$ suoti $^{\text {Finnish }}$ | $\sim$ sar $^{\text {Sumerian }}$ |
| váll $^{\text {Hungarian }}$ | $\sim$ olka $^{\text {Finnish }}$ | $\sim \operatorname{murgu}_{2}^{\text {Sumerian }}$ |

In the fourth example, there is a /t/ for the Finnish word, but a Finnish medial $/ \mathrm{t} /$ often corresponds to an Ugric $/ 1 /$. Hence it can be assumed that the Proto-West-Ugric form also had a /l/ sound.

Rule (12): The West-Ugric /r/ is always preserved in Hungarian and Sumerian, although it could change to a $\lambda$ in Greek:

Rule (13): The West-Ugric word initial $/ \mathrm{m} /$ can be preserved or changed to $/ \mathrm{n} /$ in Hungarian, and it can be preserved or changed to $/ \mathrm{b} /$ in Sumerian when the following consonant is a liquid:

$$
\text { meleg }^{\text {Hungarian }} \sim \text { mäli }^{\text {Mansi }} \sim \text { bil }_{2}^{\text {Sumerian }}
$$

Rule (14): The West-Ugric word initial /n/ can be preserved or changed to $/ \mathrm{n} /$ in Hungarian, and it is always preserved in Sumerian.

Rule (15): The West-Ugric word initial /v/ is always preserved in Hungarian, and it can change to either $/ \mathrm{m} /$ or $/ \mathrm{p} /$ in Sumerian. The change from $/ \mathrm{v} /$ to $/ \mathrm{b} /$ occurs when the following consonant is a liquid $/ \mathrm{l} /$ or $/ \mathrm{r} /$ or a nasal $/ \mathrm{m} /$ or $/ \mathrm{n} /$ :

$$
\begin{array}{ll}
\text { Sövény }^{\text {Hungarian }} & \sim \text { säw }^{\text {Mansi }} \\
\text { váll }^{\text {Hungarian }} & \sim \text { šu-mu-un }_{\text {Sumerian }}^{\text {Sinnish }} \\
\text { való }^{\text {Hungarian }} & \sim \text { murgu }_{2} \text { Wamerian }^{\text {Khanty }} \\
\text { vanal }^{\text {Sumerian }}
\end{array}
$$

Rule (16): A West-Ugric word initial or word final hiatus, that is a lack of consonant, is preserved in Sumerian but may be filled in by $/ \mathrm{j} /$ in Hungarian. For example:

$$
\begin{aligned}
& \text { juh }{ }^{\text {Hungarian }} \sim \text { uuhi }^{\text {Finnish }} \sim \text { u }_{8}^{\text {Sumerian }} \\
& \text { Szíj }^{\text {Hungarian }} \sim \text { sow }^{\text {Mansi }} \sim \text { zà }^{\text {Sumerian }}
\end{aligned}
$$

Rules (1-16) give a convincing proof that there
are regular phonetic correspondences between Sumerian and Hungarian. Next we give more detailed arguments that show that Hungarian, Minoan and Sumerian belong to the West-Ugric group of languages.

### 5.1 Finno-Ugric $\boldsymbol{\eta}>$ Ugric $\boldsymbol{\eta} \mathbf{k}>\boldsymbol{W e s t}$-Ugric $g$

Honti [22] lists the Finno-Ugric $\eta>$ Ugric $\eta \mathrm{k}$ change as item 4 among the evidences for a common Ugric language. The $\eta \mathrm{k}^{\text {Ugric }}>\mathrm{g}^{\text {Hungarian }}$ change occurs regularly. Below we show some examples that suggest that Minoan and Sumerian also shared the $\eta \mathrm{k}>\mathrm{g}$ change with Hungarian. Hence this change occurred in Proto-West-Ugric.

$$
\begin{aligned}
& * \text { ä } \eta \varepsilon^{\text {Finno-Ugric }}>* \text { ä } \eta \mathrm{k} \varepsilon^{\text {Ugric }} \\
&>\text { jaqlel } 1^{\text {Khanty }} \text { (burn) } \\
&>* \text { äg } \varepsilon^{\text {West-Ugric }} \\
&>\alpha v \gamma \eta^{\text {Greek }} \text { (torch) } \\
& \quad>\text { ég }^{\text {Hungarian }} \text { (burn) }
\end{aligned}
$$

*ši ${ }^{\text {ere }}{ }^{\text {Finno-Ugric }}>$ *ši kere ${ }^{\text {Ugric }}$

$$
>\text { tä } \eta \operatorname{ker}^{\text {Mansi }} \text { (mouse) }
$$

$$
>* \text { šegér }{ }^{\text {West-Ugric }}
$$

$$
>\zeta \varepsilon \gamma \varepsilon ́ \rho ı \varepsilon \zeta^{\text {Greek }} \text { (mouse) }
$$

$$
>\text { egér }{ }^{\text {Hungarian }} \text { (mouse) }
$$

$$
>\text { gilim }^{\text {Sumerian }} \text { (mongoose ?) }
$$

$*_{\text {su }} \varepsilon^{\text {Finno-Ugric }}>*_{\text {su }}{ }^{\text {kin }} \varepsilon^{\text {Ugric }}$

$$
>\operatorname{su} \eta^{\text {Khanty }}(\text { crack })
$$

$$
>* \operatorname{sug} \varepsilon
$$

$$
>\sigma \chi_{1} \varepsilon \iota v^{\text {Greek }}(\text { crack, v. })
$$

$$
>\text { zug Hungarian (crack, n.) }
$$

$$
>\text { zé-èg }^{\text {Sumerian }} \text { (bury, hide) }
$$

In each of the above four examples, the ancient Greek and Sumerian words are closer to the Hungarian words than to the Khanty and Mansi words because they also contain $/ \mathrm{g} /$ or the similar phonemes $/ \mathrm{k} /$ or $/ \mathrm{x} /$.

Furthermore, the ancient Greek and Sumerian words preserve some archaic features that probably existed in West-Ugric but were lost in Hungarian. These archaic features include the presence of an ending vowel in $\alpha v \gamma \eta^{\text {Greek }}$ and the initial fricative consonant in $\zeta \varepsilon \gamma \varepsilon ́ \rho 1 \varepsilon \zeta^{\text {Greek }}$. These support the

$$
\begin{aligned}
& \text { * } \text { ä̈ } \varepsilon^{\text {Finno-Ugric }}>* \text { Яä } \eta \mathrm{k} \varepsilon \varepsilon^{\text {Ugric }} \\
& >\text { taw }^{\text {Mansi }} \text { (bough) } \\
& >\mathrm{ja} \mathrm{i}^{\text {Khanty }} \text { (bough) } \\
& >* \text { äg } \varepsilon^{\text {West-Ugric }} \\
& >\dot{\alpha} \kappa \rho \varepsilon ́ \mu \omega v^{\text {Greek }} \text { (bough) } \\
& >\text { ág }{ }^{\text {Hungarian }} \text { (bough) }
\end{aligned}
$$

hypothesis of a West-Ugric branch within the Finno-Ugric family that included both Minoan (from which ancient Greek borrowed the above words) and Hungarian.

### 5.2 Finno-Ugric lm $>$ Ugric $\mathbf{m}=$ West-Ugric $m$

Honti [22] lists the $\mathrm{lm}^{\text {Finno-Ugric }}>\mathrm{m}^{\text {Ugric }}$ change as item 5 among the evidences for a common Ugric language.

$$
\begin{aligned}
& \text { *'ćolme }{ }^{\text {Finno-Ugric }} \\
& \quad>\text { solmu }^{\text {Finnish }}(\text { knot }) \\
& >\text { *ćome }^{\text {Ugric, West-Ugric }} \\
& \quad>\dot{\alpha} \mu \mu \alpha^{\text {Greek }}(\mathrm{knot}) \\
& \left.\quad>\text { csomó }^{\text {Hungarian }} \text { (knot) }\right)
\end{aligned}
$$

The $\mathrm{lm}>\mathrm{m}$ change did not occur in some $\mathrm{Ob}-$ Ugric words perhaps because of a vowel insertion between the $/ 1 /$ and the $/ \mathrm{m} /$, but it occured in the West-Ugric words. Here is an example:

$$
\begin{aligned}
& \text { *ku }{ }^{\prime} \text { 'm } \varepsilon^{\text {Finno-Ugric }} \\
& \quad>\text { kulov }^{\text {Mordvinian }} \text { (ash) } \\
& \quad>\text { kōlem }{ }^{\text {Mansi }} \text { (ash) } \\
& \quad>\text { *kum } \varepsilon^{\text {West-Ugric }} \\
& \quad>\text { kóvis }^{\text {Greek }} \text { (dust) } \\
& \quad>\text { hamu }^{\text {Hungarian }} \text { (ash) } \\
& \quad>\text { kúm }^{\text {Sumerian }} \text { (hot, heat) }
\end{aligned}
$$

### 5.3 The Ugric -kVj Suffix

Honti [22] lists the Ugric -kVj suffix as item 19 among the evidences for a common Ugric language. This suffix appears in the word for woodpecker.

$$
\begin{aligned}
& \text { *kare-kVj Ugric (woodpecker) } \\
& \quad>\text { kar-kāj }{ }^{\text {Mansi }} \\
& >\text { *kar }-\mathrm{kVj} \text { West-Ugric } \\
& \quad>\text { кр } \rho v-\gamma \text { ó } \varsigma^{\text {Greek }} \text { (woodpecker) } \\
& \quad>\text { har-kály }{ }^{\text {Hungarian }} \text { (woodpecker) }
\end{aligned}
$$

## 6 West-Ugric Grammar Similarities

The Sumerian grammar is already described in several textbooks, for example by Foxvog [16], Gosztonyi [19] and Thomsen [45]. Among those authors, Gosztonyi [19] gives a detailed comparison between Sumerian and the Hungarian grammars. While Sumerian clearly does not fit neatly into the Uralic family tree, Gosztonyi's list of similarities supports the hypothesis that Sumerian is a mixed Dravidian and Uralic language. The Dravidian and Sumerian grammatical comparisons also need to be
developed and listed in a similar manner to [19] before being able to decide which language family's grammatical features are present and to what degree. Complicating the picture somewhat is the fact that Dravidian and Uralic languages are both agglutinative and share some other features. For these common features one cannot decide whether they are inherited from one or the other language family.

To strengthen the proposal of a West-Ugric branch of the Uralic language family [41], we list some of their grammatical similarities. We focus on the similarities between Minoan and Hungarian because the Sumerian grammar is already compared with Hungarian as noted before.

### 6.1 West-Ugric is an Agglutinative Language

Sumerian [19] and the Uralic languages [26] are agglutinative, that is, they append suffixes to word roots without changing those roots. Duhoux [12] already identified Minoan to be also an agglutinative language. As further evidence, in Table 6 we display some blocks of the Phaistos Disk and the Arkalochori Axe that reveals an agglutinative structure, in particular the following:

1. There are eight different endings that each occurs at least two different times.
2. Some endings are apparently optional. For example, $\odot$ is optional because it occurs in block 6 but does not occur in block 2. Similarly, $\&$ is optional because it occurs in block 36 but not in block 44 .
3. Some endings are replaceable with another ending. For example, blocks 29 and 38 have the same apparent root but end with $\sqrt{\Omega}$ and 0 , respectively. Similarly, blocks 33 and 40 have the same apparent root but end with $\sqrt{3}$ and $5 \sqrt{2}$, respectively.
4. Whenever the endings are attached to a root, the root does not change. Table 6 indicates by red some of the apparent roots.

### 6.2 Minoan has a CVCV Root Structure

Linear B, the immediate descendant of Linear A, has a mostly syllabic writing with CV type syllables, where C is a consonant and V is a vowel [9, 49]. Hence Linear A was expected to have a similar structure as was verified in [41]. The CV type syllables fit well with Proto-Uralic word roots
that generally have two syllables with a CVCV structure [26] as shown by the following examples:

$$
\begin{aligned}
& \text { *kala > hal (fish) } \\
& \text { *kăte }>\text { kéz (hand) } \\
& \text { *mete }>\text { méz (honey) }
\end{aligned}
$$

Words with a CVCV structure can be written down conveniently using two CV syllabic symbols, which may have influenced the Linear A script to develop as a syllabic script. Table 6 already shows several roots that contain two Linear A symbols, including 资 1 and 8 and $\Delta \mathbb{y}$.

### 6.3 The -g Frequentative Suffix

Table 5 shows that Hungarian and Sumerian words share the -g suffix, which suggests that the Euphratic language also had this suffix. The -g suffix is a frequentative suffix that derives from a Finno-Ugric *nk suffix (Zaicz [54]). Here are some examples:

$$
\begin{aligned}
& \text { szipog }^{\text {Hungarian }} \text { (sniff) } \sim \text { zi-pa-ag }{ }_{2}{ }^{\text {Sumerian }} \text { (breath) } \\
& \text { sziszeg }{ }^{\text {Hungarian }} \text { (hiss) } \sim \text { sisig }{ }^{\text {Sumerian }} \text { (breeze) }
\end{aligned}
$$

### 6.4 The -k Adjective Former Suffix

Table 5 shows that Hungarian and Sumerian words share the -k adjective former suffix, which can be traced back to a ${ }^{*}$-k Finno-Ugric suffix. In some early written documents in Hungarian, this suffix appears as -h, although it later changed to an -ó/ó suffix by assimilation to the vowels at the end of root words (Zaicz [54]). It is possible that the following two words are cognate:

$$
\text { tü }^{\text {Hungarian }}(\text { needle }) \sim \text { dálla }^{\text {Sumerian }} \text { (needle) }
$$

The above suggests that the Hungarian word was originally either *tűr or *tűl. It probably meant not only needle but horn too. The ibex is an animal that is notable for its large horn. Hence a synonym for ibex may be horny, with a literal meaning of having a prominent horn. That explains the following word pairs:

$$
\text { türök }^{\text {Hungarian }} \text { (horn) } \sim \text { durah }^{\text {Sumerian }} \text { (ibex) }
$$

### 6.5 The -mány/-mény Noun Former Suffix

Table 5 shows that Hungarian and Sumerian share the -mány-/mény, noun former suffix, which can also appear in the form of -vány/vény, as shown by the following examples:
sövény ${ }^{\text {Hungarian }}$ (hedging) $\sim$ šu-mu-un ${ }^{\text {Sumerian }}$ (grass)

As mentioned above, the Hungarian word derives from sző (weave) and sövény may have meant some grassy plant, whose fibers were used for weaving. Another example is the pair:

$$
\text { menny }^{\text {Hungarian }}(\text { sky }) \sim \text { umun }^{\text {Sumerian }}(\text { lord })
$$

The menny ${ }^{\text {Hungarian }}$ may derive from *um-vány, where the $/ \mathrm{v} /$ assimilates to the preceding $/ \mathrm{m} /$ and yields umun ${ }^{\text {Sumerian }}$. The original meaning may be god, who is assumed to dwell in the sky, that is, a heavenly person. Later this was generalized to mean lord, which is the dictionary entry for Sumerian word.

### 6.6 The -r Frequentative Suffix

Table 5 also shows that Hungarian and Sumerian also words share the -r frequentative suffix, which can be traced back to an *-r Finno-Ugric suffix. For example:

$$
\text { csupor }^{\text {Hungarian }} \text { (bowl) } \sim \text { zabar }^{\text {Sumerian }} \text { (bowl) }
$$

The above apparently derives from csepp ${ }^{\text {Hungarian }}$ (drop of water). Hence csupor ${ }^{\text {Hungarian }}$ initially meant a bowl that collected drops of water, perhaps rain drops. A nail and a spear are similar to each other in both having a pointed end. A nail is normally used only once during a construction of something. In contrast, a spear is used several times. Hence it needs a frequentative suffix:

$$
\text { szeg }^{\text {Hungarian }} \text { (spike, nail) } \sim \text { šugur }^{\text {Sumerian }} \text { (spear) }
$$

Similarly, a Sumerian word that means a single pig can be put together with a Hungarian word that means herd as follows:

$$
\text { csokor }^{\text {Hungarian }}(\text { herd }) \sim \text { šah }_{2}^{\text {Sumerian }} \text { (pig) }
$$

Since csokor ${ }^{\text {Hungarian }}$ is cognate with ćuker ${ }^{\text {Zyrian }}$, the word derives from West-Ugric to Sumerian and not vice versa. That makes sense because pigs were first domesticated in Anatolia and not in Mesopotamia.

### 6.7 Other Suffixes Ending with /k/

A problem with a pure syllabic script is that many suffixes do not fit into a CV structure. For example, consider the following Hungarian suffixes that end with a $/ \mathrm{k} /$ phoneme. We also give some examples,
as they appear in the earliest Hungarian language documents. One of the frequently consulted documents is the $12^{\text {th }}$ century Halotti Beszéd (Funeral Sermon) [7], which will be referenced as HB below.

1. /-ak, -ek, -ok/ are for the plural of words that end in a consonant. The vowel is chosen according to vowel harmony rules. Some examples are hal-ak (fishes) and kez-ek (hands) and ablak-ok (windows).
2. $\mathrm{k} /$ is the plural of words that end in a vowel. For example, falu-k (villages) or $k a p u-k$ (gates).

3 . $/-\mathrm{k} /$ is the 1 st person singular present tense verbal suffix in the indeterminate case.
4. /-juk, -jük/ is the 1 st person plural present tense verbal suffix in the determinate case. For example, tümet-jük (we bury) appears in HB. As another example, present Hungarian uses számol-juk a pénzt (we count the money).
5. /-juk/ is also the 3rd person plural possessive suffix. For example: kutyá-juk (their dog).
6. /-muk/ is the 1st person plural present tense verbal suffix in the indeterminate case. This appears as vogy-muk in HB. This suffix appears to be simply the composition of the /-om, em/ first person singular verbal suffix in the determinate case and the plural $/-\mathrm{k} /$, ex: olvasunk (we read a book).
7. /-nak, -nek/ is the third person plural present tense verbal suffix in the indeterminate case, for example, esz-nek (they eat).
8. /-nak, -nek/ is also a marker of the possessor of an object. For example, a ló-nak a lába (the horse's leg).
9. /-nak, -nek/ is also a lativus suffix. For example, fal-nak megy (goes to a wall), hegy-nek fordul (turns towards a mountain).
$10 . /-\mathrm{omk} /$ is the 1 st person plural possessive suffix, which appears as uromc [ur-omk] (our lord) in HB. Etymologically, this suffix appears to be simply the composition of the first person possessive /-om, -am, -em/, as in ház-am (my house) and the plural $/-\mathrm{k} /$. Today, this suffix appears as /-unk, -ünk/, as in ház-unk (our house).

Table 7．Some blocks of the Phaistos Disk and the Arkalochori Axe inscriptions arranged to reveal repeatedly used suffixes and word roots．The Arkalochori Axe symbols are transliterated into the Phaistos Disk symbols using［39］．

The Minoan symbol represents not a syllable but some single phoneme because it is used only at the end of the words with one exception． According to Table 7，in the Minoan language about half of the suffixes end with a symbol． Remarkably，about half of the suffixes end in $/ \mathrm{k} /$ in Hungarian．Therefore，it is tempting to associate Minoan with Hungarian／k／．Moreover，the above Hungarian suffixes could be grouped into three groups：（1－3），which have the form $/ \mathrm{Vk} /$ ， where the vowel V is optional，（4－5），which have the form $/ \mathrm{jVk} /$ ，and（ $6-10$ ），which probably had the form $/-\mathrm{mVk} /$ assuming $\mathrm{m}>\mathrm{n}$ or $\mathrm{n}>\mathrm{m}$ changes in some cases．These groups seem to match a natural grouping of the Minoan words into those that end with $F$ ，with $\%$ and with 为 respectively．

Old Hungarian contains two letters that denote the $/ \mathrm{k} /$ phoneme： $\mathcal{V}$ and $\boldsymbol{V}$ ．According to some researchers one letter was used only within the words and the other was used only at the end of words．When carving the symbols into wood，a diamond is a convenient simplification of a circle， which may have denoted a human head［48］．

Therefore，the shapes of the Minoan symbol and the Old Hungarian $\diamond$ symbol have a connection．Moreover，the Minoan symbol depicts the head of a man with prominent hair．The Mansi word for man is $/ \mathrm{kom} /$ ，while the ancient Greek word for hair was $/ \mathrm{komi} /$ ，which may have been borrowed from Minoan．This shows a $/ \mathrm{k} /$ or a $/ \mathrm{ko} /$ phonetic connection between the two symbols．

## 6．8 Conjunction

Table 8 shows another pair of blocks that allows us
to suspect that the symbol $\nabla$ is a conjunction symbol，meaning＂and，＂a disjunction symbol， meaning＂or，＂or it is some prefix．The shape of this symbol read from left－to－right suggests that it may denote two paths that merge together，that is，a conjunction．

When rotated ninety degrees，the symbol also reminds one of the Old Hungarian $\Lambda$ symbol， which denotes the $/ \mathrm{J} /$ phoneme and occurs in the Hungarian words $s$ and és that both mean＂and．＂

## 6．9 Assimilation by Consonant Doubling

Table 9 shows the doubling of some symbols before the hypothetical suffixes．The doubling of consonants before suffixes is common in Hungarian and result from assimilation between the last

Table 8．Possible Minoan conjunction or affix．

| Block | Conjunction or Prefix | Root | Suffix |
| :---: | :---: | :---: | :---: |
| 6 |  | 登1 | \％ $\mathrm{F}_{\sim}^{3}$ |

| \％ | ／s／，／z／，／J／，／n／／c／ | I，Y | ／s／，／3／ |
| 無 | ／s／，／z／，／J／，／n／／c／ | $E$ | ／z／ |

consonant of the root and the beginning consonant of the suffix. Table 10 shows some examples.
 similarly to the Hungarian doubled consonants and likely denote one of the consonants that is doubled in Hungarian except $/ \mathrm{g} /$, which we already associated with $\rangle$.

### 6.10 Assimilation by Palatalization

Assimilation can occur without a doubling in case of some consonants. Table 11 gives some examples from Hungarian.

The palatalized sounds in Table 11 may not have been originally used in the Hungarian language within word roots, but they tend to occur naturally with the addition of suffixes that start with $/ \mathrm{j} /$. It is likely that in the Minoan language the palatalized sounds also first occurred as a result of assimilation.

Table 12 shows that in block 22 a palatalization during assimilation can be suspected because the apparent assimilation yields a symbol that is rarely used. Moreover, it is never used at the beginning or the end of words, where palatalization is absent. It is also noticeable that it occurs only before $\%$ which we already associated with the /-juk, -jük/ suffix. Compare Phaistos Disk block 22 with the Arkalochori block 3, where there is no assimilation sound in a similar context before which we associated with the $/-\mathrm{Vk} /$ suffix.

The above grammatical comparisons enable the identification of the phonetic values of some of the Phaistos Disk symbols as shown in the first two columns of Table 13. It is apparent from Table 13 that the Old Hungarian alphabet has a strong connection with the Minoan symbols. After such a realization, the logical step was the thorough comparison of all Minoan and Old Hungarian symbols to identify possible phonetic values of the Minoan symbols [37]. The script comparison was recently extended to the Indus Valley Script [11].

Fig. 3 shows our proposal [40] to place Minoan into West-Ugric branch of the Uralic language family. Fig. 3 implies that Minoan and Hungarian share not only the characteristic Ugric features but also the characteristic West-Ugric features, that is, the language innovations that occurred after the separation of West-Ugric and Ob-Ugric and before the separation of Minoan and Hungarian. Linguists call Proto-Hungarian (ösmagyar in Hungarian) the language that separated from the Ob-Ugric branch and progressed toward present day Hungarian until
the end of the 9 th century $[21,26]$. Hence these characteristic West-Ugric features can be none other than some of the Proto-Hungarian linguistic innovations that were previously considered to be pertinent only to the evolution of the Hungarian language. Hence the precise identification of the characteristic West-Ugric features is tantamount to dividing the ősmagyar period into an early phase, which is applicable to Minoan too, and a later phase, which is not applicable to Minoan but only to Hungarian. Below we give some features that are shared by Minoan and early Proto-Hungarian. These shared features support putting these two languages into a common West-Ugric branch of the Uralic language family.

### 6.11 The Ugric Root + Possessive + Case Order

Finally, Honti [22] lists the word structure:

$$
\text { Root }+ \text { Possessive }+ \text { Case }
$$

order as item 20 among the evidences for a common Ugric language.
The translation of the Arkalochori Axe [40] includes the word szem-jöd-nek (for your eye), which has the root + possessive + case order. Hence Minoan also has this structure. According to Foxvog [16] p. 28, Sumerian has the same structure. Hence West-Ugric probably had the same structure too.

### 6.12 A Parser for Minoan Possessive Phrases

Both Minoan and Hungarian possessive phrases are composed of a possessor followed by the possessed object. Both the possessor and the possessed object are indicated by suffixes. The possessor is indicated by a /-nak/ suffix, while the possessed object is indicated by an $/-a /$ suffix. Similarly, in Sumerian the possessor is indicated by a /-ak/ suffix (Foxvog [12], p. 39). In Minoan and Hungarian, the possessor suffix /-nak/ is optional and can be omitted. Table 14 shows that the Phaistos Disk contains two examples of this structure. Although we identified has the syllabic value $/ \mathrm{na} /$, hence the combination is another way of writing the /-nak/ suffix.
A computer program can be also written to look for adjacent pairs of blocks with the first ending in /nak/, expressed in any form, and the second ending with /-a/. A context-free-grammar [36] or a constraint query language [25] can be used to express Minoan possessive phrases. In terms of a
context－free－grammar the Minoan possessive phrases can be expressed as follows：

```
Pphrase \(\rightarrow\) Possessor Possessed
Possessor \(\rightarrow \mathrm{Nd}-\) nak \(\mid \mathrm{Nh}-\) nek \(|\mathrm{Nd}| \mathrm{Nh}\)
\(\mathrm{Nd} \rightarrow\) NdSingular \(\mid\) NdPlural
\(\mathrm{Nh} \rightarrow\) NhSingular | NhPlural
NdSingular \(\rightarrow \mathrm{NdC} \mid \mathrm{NdV}\)
\(\mathrm{NhSingular} \rightarrow \mathrm{NhC} \mid \mathrm{NhV}\)
NdPlural \(\rightarrow\) NdC -ak \(\mid \mathrm{NdV}-\mathrm{k}\)
NhPlural \(\rightarrow\) NhC -ek \(\mid \mathrm{NhV}-\mathrm{k}\)
NdC \(\rightarrow\) <deep vowel nouns ending in consonant>
NhC \(\rightarrow<\) high vowel nouns ending in consonant>
NdV \(\rightarrow\) <noun with deep vowels ending in vowel>
NhV \(\rightarrow\) <noun with high vowels ending in vowel>
Possessed \(\rightarrow\) PossessedSingular | PossessedPlural
PossessedSingular \(\rightarrow\) NdC -a \(|\mathrm{NdV}-\mathrm{ja}|\)
        NhC - e | NhV -je
PossessedPlural \(\rightarrow\) PossessedSingular -i
```

In the above grammar，the terminals are indicated by brackets $<>$ ，choices by $\mid$ ．Each time a possessive phrase is parsed，the grammar starts at Pphrase，which stands for＂possessive phrase．＂The possessive nouns can be either singular or plural． Plural possessive nouns ending with a vowel have a ／－k／suffix，while those ending with a consonant have either an／－ak／or an／－ek／suffix according to vowel harmony rules．Similarly，the vowel harmony rules require an $/-\mathrm{a} /$ or an $/-\mathrm{e} /$ to indicate being possessed．In addition，the phoneme $/ \mathrm{j}$／is inserted before the last two as a gliding sound if the noun ends with a vowel．

The possessed object or objects take first the $/-a /$ suffix，indicating belonging to the preceding possessor and then the plural marker／i／．The different plural marker and the different order with respect to the main suffixes，that is，preceding／nak／ but following／－a／also help distinguish between possessor and the possessed object（s）．For example，

Table 14．Minoan possessive phrases．Each Minoan phrase consists of two blocks．The translations are in Minoan below that in English（in italics）．

| Blocks | Possessor | －nak | Possessed | －a |
| :---: | :---: | :---: | :---: | :---: |
| 7－8 | 3 包 |  | M P | 感 |
|  | fény light＇s |  | tavasz－a spring |  |
| 45－46 | 第 n | A ${ }^{2}$ | $\underset{y}{*} y^{4}$ | 密 |
|  | más－nak king＇s |  | húsz lány－a daughter |  |

to possessive phrase＂embereknek házai＂（people＇s houses）can be parsed as follows：

Pphrase $\rightarrow$ Possessor Possessed
Possessor $\rightarrow \mathrm{Nh}-$ nek
$\mathrm{Nh} \rightarrow$ NhPlural
NhPlural $\rightarrow$ NhC－ek
$\mathrm{NhC} \rightarrow$ ember
Possessed $\rightarrow$ PossessedPlural
PossessedPlural $\rightarrow$ PossessedSingular－i
PossessedSingular $\rightarrow$ NdSingular -a
NdSingular $\rightarrow \mathrm{NdC}$
NdC $\rightarrow$＜ház＞
The above gives＂ember－ek－nek ház－a－i，＂which is the correct parsing of this possessive phrase．

## 7 Related Works and Discussion

Section 1 already mentioned many of the prior researchers who worked on identifying Sumerian and Hungarian parallels．Similar to them，Aczél［1］ and Varga［47］worked on Greek and Hungarian parallels，building large dictionaries．Although they also ignored Uralic linguistics，their work called for an explanation．Our earlier work［41］found an explanation by recognizing that some of the word parallels may be due to a common proto－language of Minoan and Hungarian．

Now the picture of language evolution can be further completed as shown in Fig．3．The figure explains that Minoan and the related Hattic language belong to the Uralic family tree． Moreover，Greek is a descendant from both Indo－ European and Uralic，while Sumerian has both Dravidian and Uralic ancestors．

Fig． 3 implies some modification of the chronology of Uralic language evolution because West－Ugric had to exist before Sumerian and Minoan became separate languages．The precise chronology is often one of the hardest problems to identify in comparative linguistics．A comparison of two languages tells little directly about the chronology．

Róna－Tas［42］estimated the separation of the Ob－Ugric languages from the rest of the Uralic family tree to have occurred between 3000 and 2000 BC ．This is somewhat farther back in time then many other linguists＇estimates，but the time may still need to be pushed back more than a thousand years to accommodate the known Sumerian and Aegean chronologies．

Fig. 3. A partial diagram showing the Dravidian (yellow), Indo-European (red) and the Uralic (blue) language families. Note that the Greek (purple) and the Sumerian (green) languages descend from two different language families.

The basis of Róna-Tas’ estimate is actually far more interesting than the estimate itself. Róna-Tas makes the observation that certain processes of sound change could only occur in a sequence and not in parallel. For example, the process of wordinitial $/ \mathrm{g} />/ \mathrm{h} />/$ / changes, that is, the gradual loss of the initial $/ \mathrm{g} /$ must have occurred before the process of word-initial $/ \mathrm{k} />/ \mathrm{h} /$ changes, when $/ \mathrm{k} /$ is followed by a back vowel, started. Otherwise, the $/ \mathrm{k}$ / initial would have also completely disappeared.

Clearly, if the first process lasted $x$ number of years, the second process lasted $y$ number of years, then we can conclude that the evolution of a language in which both processes occurred in a sequence took at least $x+y$ number of years. However, we cannot derive any upper bound because there could have been some number of extra years before the first process ended and the second process started. While the elapse time of a process could be estimated relatively well, estimating the extra years seems highly uncertain. Therefore, Róna-Tas' work implies that the separation of the Ob-Ugric languages from the rest of the Uralic family tree occurred at least $2500 B C$ ( $\pm 500$ years for various uncertainties in estimating the duration of the sound change processes).

## 8 Conclusions and Future Work

It has always looked counterintuitive to have Sumerian be a language isolate given its location in Mesopotamia, which is essentially at the intersection of three continents. It turns out that instead of being a language isolate, Sumerian is actually the combination of at least two major language families. In this paper we identified Dravidian and Uralic and in particular Proto-Tamil and Proto-Hungarian, respectively within those two language families as major contributors to the development of Sumerian. It cannot be excluded currently that a third language to be still identified also contributed to Sumerian. It seems that the great difficulty in classifying the Sumerian language was not its isolation but its varied interconnections with several other languages.

There still remains much work to be done to fill in the details of the picture shown in Fig. 3. In particular, as Section 9 mentioned, the chronology of the development of Sumerian and its related languages needs to be worked out in detail. It is hoped that the complete settling of the Sumerian language will shed a major light on the origins and prehistory of languages in general [35].
